

SANDPAPER GRADES

Sandpaper comes in different 'grits' (the roughness or coarseness), and choosing the right grit for the job makes all the difference.

Remember : the higher the number the finer the sandpaper.

| Name | Grit | Use |
|------------------|----------|---|
| Course | 40 - 60 | Ideal for heavy-duty sanding or removing old finishes. Great for rough wood or sanding down large areas. |
| Medium | 80 - 120 | Good for smoothing surfaces after using coarse grit. It's perfect for removing scratches and prepping wood for finishing. |
| Fine | 150 -180 | Used for smoothing surfaces before finishing, giving wood a nice, even feel. Perfect for light sanding. |
| Very Fine | 220 + | Used for finishing touches, smoothing surfaces before applying paint or stain, and achieving a polished look. |
